MODERNISE AND MAXIMISE

Looking to embrace the benefits of public cloud but commercial and regulatory challenges getting in the way? Take your first modernisation steps using hybrid cloud, allowing you to build new, cloud native applications in public cloud while safely sustaining your traditional workloads in private cloud.

Is your business looking to realise the value of cloud but constrained by CapEx, regulations, and data sovereignty requirements?

Business Challenges

Traditional operating practices, conservative financial principles, and historical investments are inhibiting your business from taking advantage of innovative technology and operating models.

Your business has perceived concerns over data sovereignty, regulatory compliance, and moving from a CapEx to an OpEx-based model.

Introducing Modernise and Maximise

Six Degrees' hybrid cloud services can provide a path forward to modernise and maximise your IT infrastructure through services that remove blockers, allowing you to capitalise on the capabilities and leverage the benefits of cloud.

Rather than focusing purely on public cloud, Six Degrees dovetails UK sovereign private cloud services delivered on-premises from a Six Degrees data centre with a choice of public cloud services, all while providing a common set of managed services to deliver a consistent customer experience, providing you with surety of direction going forward.

Six Degrees can empower your business with the ability to leverage capabilities that you may have felt were not available to you through reliable, trustworthy cloud solutions that provide enhanced business agility.

Secure, Integrated Cloud Services

Why Modernise and Maximise?

What It Does	Why This Matters	What This Means
Reliable and trustworthy cloud solutions.	Your business can rely on Six Degrees to provide robust and flexible, well architected cloud platforms located in the UK and aligned to key regulatory standards.	UK data sovereignty, regulatory compliance, and working with a dependable partner.
Future-proofed with more business agility.	Businesses with deep sunk investments in assets, data centres and infrastructure may feel restricted and frustrated by their need to sweat their assets and limited in the potential for capability enhancements.	Your business can leverage a broad range of hybrid cloud solutions to provide benefits you didn't realise or believe were available to you without breaking your financial operating model.
Intelligence-led decision making.	Data driven and uninhibited solution exploration, enabling you to consider the 'art of the possible' – a crucial element to driving business innovation.	Six Degrees offers a comprehensive set of solutions to businesses in various stages of their infrastructure and IT asset lifecycles, based on our experience and breadth of capability to deliver the maximum value during modernisation efforts.
Meets your data centre modernisation challenges.	Organisations are under pressure to ensure they are maximising the value of their data centre spend, from the physical data centre to the hardware within. Six Degrees can provide you with a data centre exit strategy that meets the demands of both your current and future workloads.	Organisations can accelerate their data centre modernisation strategies by 'lifting and shifting' their traditional workloads to a Six Degrees operated private cloud, while also proving an on-ramp to public cloud for their future state applications.
Flexible financial terms.	Choice of CAPEX-based private cloud, OPEX-based public cloud, or a blend of both via hybrid cloud solutions.	Organisations can select the right cloud purchasing model based upon the workloads they are deploying along with any budgetary/procurement considerations.
Host traditional workloads alongside new cloud-native applications.	Organisations may not be able to jump straight into cloud native application delivery due to existing workloads not being cloud friendly, meaning a 'cloud first' policy is not always the right answer.	Six Degrees offers you the ability to host your traditional workloads from our private cloud services with simple connectivity to public cloud services, allowing you to refactor your workloads in stages rather than 'all or nothing'.
A single plane of glass to observe and manage your hybrid cloud from.	Organisations often avoid hybrid or multi-cloud deployment models due to the monitoring, management and security concerns they generate. Six Degrees' hybrid cloud offers a common set of tools and managed services across your entire hybrid cloud estate.	Six Degrees takes your private, public, and hybrid clouds and delivers them simply as 'one cloud', providing you with simplified visibility and a consistent set of managed services.
